Programming Languages

→ Java

→ C

→ C++

→ Python

→ TypeScript

→ Rust

Human Languages

→ Spanish (Native)

→ English (Fluent, C2)

Open Source Contributions

→ Neovim: Added static build support, closing an 8-year-old feature request.

→ Universal Blue: Prototyped NVIDIA drivers packaged as an OSTree OCI image.

Alex Díaz

Experience

December 2023 - Present | **Sr. Systems Development Engineer** *Amazon*

- Grew the stuck-shipment platform I designed in 2023 into a proactive shipment issue detection system I still own, integrated with two partner teams for two critical workflows, unblocking ∼10M shipments/week and saving ∼$100M annually.
- Led and mentored 6 engineers to bootstrap ∼20 critical Amazon Fulfillment Network services in a new region, meeting deadlines and unblocking its launch; authored service-agnostic runbooks so the team needed minimal support from owning teams.
- Grew the emergency recovery tool I created in 2023 from a single use case into the worldwide standard recovery platform for all Amazon warehouses, automating key steps of warehouse recovery after large-scale events (fire, flood, etc.) and saving ∼8 weeks of labour per incident across 6+ incidents/year.
- Provide high severity support for critical services, documenting and preparing communications to senior leadership.
- Partnered with a Principal Engineer to reproduce the failure behind a prolonged, multi-million-dollar Sev1 outage, enabling its diagnosis and a permanent fix by the owning team with no recurrence since.
- Building an AI-driven test automation platform that uses coverage metrics and API models to generate tests, targeting a 20% increase in test coverage across the organization.

April 2023 - November 2023 | **Systems Development Engineer** *Amazon*

- Designed and built a safe inventory deletion system for emergencies in Amazon Warehouses saving ∼4000 hours of labour every year summing up to $5M/yr.
- Led architecture design and execution, mentoring junior engineers through implementation and delivery of a platform processing 5k requests/week.
- Implemented technically involved parts of ongoing projects (authentication, database access, performance-related functionality).

June 2020 - April 2023 | **DevOps Engineer** *Amazon*

- Created the first version of a web-based emergency recovery tool. It automated a clunky and error-prone manual process which resulted in savings of ∼1500 engineer hours per year. (AWS API Gateway, AWS Lambda, DynamoDB, SQS)
- Architected the back-end application on AWS Lambda to lower ongoing maintenance costs. (Java, Dagger, AWS Lambda, Smithy)
- Designed and implemented the front-end website using React, Redux and TypeScript following best practices to achieve optimal performance and responsiveness in mobile and under poor connectivity. (TypeScript, React, Redux, API Gateway, AWS Lambda)
- Designed the first version of a data processing platform to analyze and detect stuck shipments within the Amazon Fulfillment Network. (AWS Glue, Athena, ECS)

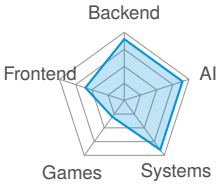
Tech

→ AWS
→ Docker
→ Kubernetes
→ Terraform

Frameworks

→ Qt
→ Boost
→ Abseil
→ SFML
→ Dear ImGui

Stats



- Supported multiple teams on high severity and low severity incidents, decreasing resolution time.
- Developed a pipeline scanning tool to analyze Full CD best practices across 1,000+ pipelines, and drove its adoption to improve the Full CD posture of 30 pipelines.
- Improved an internal tool for automatic dashboard generation to show configured alert thresholds.

May 2017 - May 2020 | **Systems Engineer** *Fundserv*

- Implemented a fully-automated pipeline to provision VMs on VMware ESXi using Jenkins and Ansible.
- Developed customized Ansible inventory plugin to get inventory information via the vSphere Automation SDK.
- Developed a three-tiered Angular/Spring Boot Java application for accounting.
- Developed a new service management facility built on ksh88.

Education

2019 | **Red Hat Certified Systems Administrator** *Red Hat*

2019 | **Red Hat Certified Ansible Specialist** *Red Hat*

2018 | **Computer Programming Diploma** *Seneca College*

Personal Projects

2026 | **Pasta** *Java, Quarkus, Go, React, AWS CDK*

Paste service that runs snippets in eight languages in sandboxes (Podman or one-shot AWS Lambda) driven by a Go executor; deployed with CDK on ECS behind CloudFront and WAF.

2026 | **Tetris** *C++20, SFML*

Tetris clone with the game logic in a standalone, unit-tested library and an SFML front end. Game state is immutable and deterministic from a seed, with SRS wall kicks and a 7-bag randomizer.

2026 | **fedora.help** *Python, MkDocs*

Unofficial guide to the software Fedora cannot ship: multimedia codecs, NVIDIA drivers and third-party repositories.

2013 | **Email Archiver** *C++, Qt/Cascades*

Native BlackBerry 10 email backup app for offline access. Earned “Built for BlackBerry” for its use of the Qt-based Cascades framework; 10,000+ trial downloads and 1,000+ purchases in its first month; featured on CrackBerry.

2013 | **BitShortener** *C++, Qt/Cascades*

Native BlackBerry 10 client for the Bitly URL shortener. Earned “Built for BlackBerry”, which led to BlackBerry awarding me a Limited Edition BlackBerry Z10.
